

```
1 // DecimalFormat is a class that can round numbers off
2 // Note however that it works as a String, not as a number.
3
4 import java.text.DecimalFormat;
5
6 public class RoundOffTwo
7 {
8
9     public static void main (String[] args)
10    {
11        double myDouble = 0.0;
12
13        // The instantiated object "d" will round to two decimal places
14        DecimalFormat d = new DecimalFormat("0.00"); // String
15
16        myDouble = 65.876559;
17
18        System.out.println(d.format(myDouble));
19        System.out.println("The rounded number is " + d.format(myDouble));
20
21        // double myDouble2 = d.format(myDouble); Gives an error.
22
23        String myDoubleSt = d.format(myDouble);
24        System.out.println(myDoubleSt);
25        System.out.println("The rounded string number is " + myDoubleSt);
26
27    }
28
29 }
```
